Real bug: CPython gh-130941, fixed April 2025

"Fix configparser parsing values with allow_no_value and interpolation set" · 384 of 3,456 configurations fail

Test suite	Tests	Result
Covering only	9	Missed: no test failed
One-fault locating	**19**	**Caught and named the cause:** `allow_no_value = True + interpolation = extended`
Two-fault locating	49	Caught: "no single explanation fits"

The named pair is the one in the official bug report. Input: the regression test from the fix (our original inputs never triggered this bug). In our test the failure also needs '=' as a separator, because of how that input is written.
